

Concrete Floor Saw Cutting

Floor saw cutting can be carried out with a variety of machines powered by petrol or 3 phase electric.

These machines are used to cut reinforced concrete or tarseal/asphalt to ease the removal of redundant material or to form expansion joints in new slabs. The benefit of Pro-Cut Concrete's sawing methods are that they leave the remaining floor slab undisturbed. This in turn gives our Clients a clean cut line to continue with their required activities.

The machinery Pro-Cut Concrete use for concrete floor sawing is the latest in concrete technology. The high 35 horse power motor can power through the toughest jobs quickly and efficiently. Our machines and operators can cut through concrete floors and asphalt up to a depth of 300mm
