

## Hydraulic Cutting

Ease of operation for sawing through concrete, reinforced concrete, masonry, aggregates, stone, block and pipe.

Reduced noise and exhaust make hydraulic tools the ideal product for interior structure remodelling within occupied Schools, Offices, Medical or Industrial Buildings.

Hydraulic concrete cutting methods are designed to allow for the cutting of concrete indoors or in other confined spaces, without the risk of ill health or injury from fumes expelled by petrol powered saws.

This cutting method is perfect for concrete in bathrooms, toilets, internal doorways, access points or during any type of indoor renovation, construction and demolition work.
